Inter-Hour Requirements

- 700,800 hours of data available
- Aurora determines thermal and hydro dispatch
- Council determined available hydro flexibility
 - Minimum and maximum output for 14 different periods in the year over all 80 years (two each in April and August)
 - For longer horizons, lower amount of flexibility available
- For each hour, run through and calculate flexibility available, deployed and spare for all thermal units and total hydro (big 4 only were studied)
- MATLAB code available (though needs to be cleaned up)

Literature Review

Previously presented

42

© 2015 Electric Power Research Institute, Inc. All rights reserved.

EPR | ELECTRIC POWER
RESEARCH INSTITUTE

Assessing Flexibility

- Increased ramping expected:
 - Wind and Solar
 - Potential for uncontrolled DER
- Need to be able to ensure sufficient capability in the system to provide operational flexibility
- Methods need to do some or all of following:
 - Measure requirements for flexibility
 - Assess whether system can meet requirements
 - Complement existing or altered IRP process

43

© 2015 Electric Power Research Institute, Inc. All rights reserved.

EPR | ELECTRIC POWER
RESEARCH INSTITUTE

Flexibility Requirements - methods

- 1. Historical or simulated data and a risk preference
 - Cover a certain percentage of historical or simulated data based on risk preference
 - E.g. Cover all historical wind data based on 95th percentile, chosen to represent CPS2 score
 - Sometimes based on expected conditions, e.g. need is higher in mid-point of wind output
 - Can be captured for different datasets relatively easily and well verified with numerous studies
 - Notable examples: NREL, PNNL, Doherty, NERC IVGTF
- 2. Run full unit commitment and economic dispatch study
 - Alter constraints to reflect need for flexibility
 - Use metrics which track violations
 - Examples: Bouffard, E3 REFLEX, Da Silva
 - More detailed simulation needed, but may better reflect reality if system operations known

44

EPR | ELECTRIC POWER
RESEARCH INSTITUTE

Flexibility Requirements (ctd)

- Methods will examine different time scales
 - <5 mins, 5 mins, 10 mins, 1 hour, 3 hours
- May capture locational aspects if required
- Can be based on dynamic procurement or static number
- Never try to capture 100% of all potential outcomes
 - NERC scores don't require this

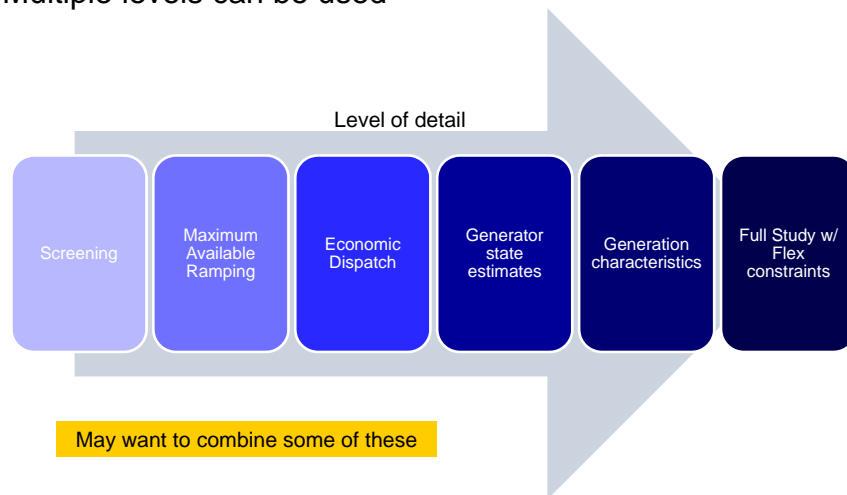

45

© 2015 Electric Power Research Institute, Inc. All rights reserved.

EPRI | ELECTRIC POWER RESEARCH INSTITUTE

Assessing flexibility adequacy

- Multiple levels can be used

46

© 2015 Electric Power Research Institute, Inc. All rights reserved.

EPRI | ELECTRIC POWER RESEARCH INSTITUTE

Screening Methods

- Highest level: Assess ramping capability of system without regard to availability of resources
 - Example: IEA FAST1 – assess ramping capability against a number of snapshot points in time
 - Overly simplistic and misses generation limitations
- More detail: PGE IRP
 - Quantify required flexibility up to one hour
 - Examine available by turning on all capacity and moving to max capacity as soon as possible
 - Compare with required capacity
- Kirschen/Ma
 - Dependent on start time, ramp rate and operating range
 - Flexibility index presented for units and system
 - A means to measure and compare flexibility across resources

47

© 2015 Electric Power Research Institute, Inc. All rights reserved.

 EPRI | ELECTRIC POWER RESEARCH INSTITUTE

Intermediate assessment

- Schillmoeller/NWPCC: Requirement for and provision of imbalance reserves
 - Calculates cumulative ramp duration curve
 - Orders resource over different time scales
 - Ability of capacity to recover over the course of a net deployment is then described → path
 - Requirement → minimum resource required meeting all of the paths
- IEA FAST v2: Basic dispatch stack
 - Examines optimistic and pessimistic assumptions
 - Optimistic: Commit excessive capacity
 - Pessimistic: Do not account for various constraints
 - Examine 1 year and compare requirements and available resources
 - Calculate number of periods when flexibility is short
 - Extensive data required, but not computation
- EPRI (2013)
 - Levels 1 and 2 of InFLEXion flexibility assessment tool
 - Level 1: Variability based on historical analysis (similar to other methods)
 - Level 2: Ramping capability, standing start of fleet, etc – similar to other methods above
 - Min gen available per hour of year (curtailment)
 - Up ramping similar to PGE methods

48

© 2015 Electric Power Research Institute, Inc. All rights reserved.

 EPRI | ELECTRIC POWER RESEARCH INSTITUTE

Detailed Assessment

- Insufficient Ramp Resource Expectation (Lannoye)
 - Similar to LOLE, but for ramps
 - Probabilistic method to calculate frequency of deficits
 - Dependent on production cost modeling
 - Applied to up and down in multiple time intervals
- EPRI methods - extension of IRRE
 - Probability of flexibility deficit and expected unserved ramping: Deterministic metrics looking over 1+ year at various percentiles
 - Well being analysis combining these metrics
- E3 REFLEX tool: Detailed Monte Carlo simulation under a range of operating conditions
 - Availability of resources determined using conventional production simulation tools
 - Large number of 3-day scenarios simulated, energy and reserve violations tracked
 - Shapes determined to be used with tools based on flexibility required with penalties for not meeting energy or reserve

49

© 2015 Electric Power Research Institute, Inc. All rights reserved.

 EPRI | ELECTRIC POWER RESEARCH INSTITUTE

Detailed Assessment (ctd)

- Menemenlis: Effect which operational processes have on the deliverability of the flexibility available from generators
 - Not the technical capability of a system's resources
 - More suited to operations than planning
- Studarus: Operational flexibility of hydro fleet
 - Time series of flexibility available
 - Compares deterministic representation of flex available based on confidence intervals with deterministic representation of requirements
 - Can be used to visualize time periods into the future
 - Detailed operational flexibility assessment
- SERVM/EPRI study: Resource adequacy/production cost tool
 - Adopted to assess ability to meet uncertainty
 - Large number of draws of system operations
 - Can quantify impacts of variability and uncertainty on LOLE

50

 EPRI | ELECTRIC POWER RESEARCH INSTITUTE

Conclusions

- Range of methods is quite large
 - Categorized here based on detail

- Need to base method used on goal of study
 - Detailed operational or resource planning?
 - New resources, or check for reliability of system?

- Levels used should also be based on data and resources available to do study
